

RaClips

RaClips are an excellent retaining system for your front rack-mounted handle bar bag. They are easy to install and once in place provide quick and smooth means of securing the bag to the rack. Simply slide the clips open and the bag is disengaged. RaClips replace straps and other cumbersome means of securing the bag, making the process simple, fast, and accurate.

RaClips can be fitted to any rack with 5/16" tubing and need a minimum of 1 1/4" clear rail to grip rack.

RaClips should not be used as the sole means of attachment to rack. They are meant as stabilizers in conjunction with use of a decaleur or other means of retention.

1. With the bag removed from the rack, position assembled clips on rack in a clear and unobstructed position, favoring a forward placement where possible.

2. Place bag on rack with clips in optimal location. Make sure the rack and bag are centered and the bag is sitting in its natural position.

3. Disassemble the clips, leaving the retention bracket (D) in place. Mark the four holes on bag with marker or pointy tool.

4. Make 5mm holes where you have made your marks. This can be done with a hole punch or nail. Use a wooden block or other means to support the bag from inside.

5. If your bag has a stiffener, place it in the bag, make sure it's in its natural resting place and mark it through the holes in the base of the bag. Punch these holes like you did in the bag.

6. Put the stiffener in the bag and assemble the clips. The nuts and backing bracket (A, B) sit inside the bag, with the other parts outside. Secure with the bolts and position the bag on the rack.
